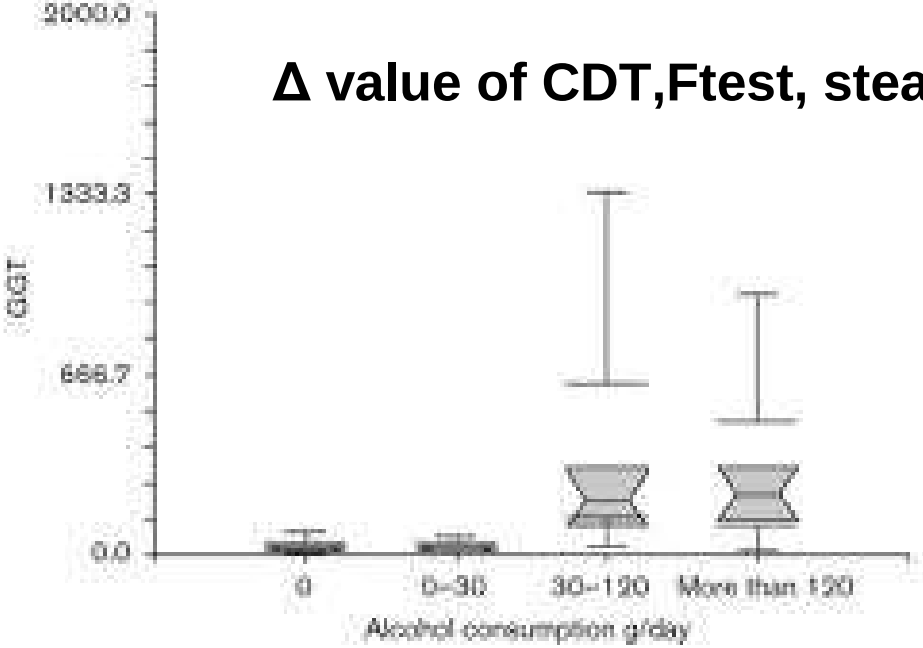
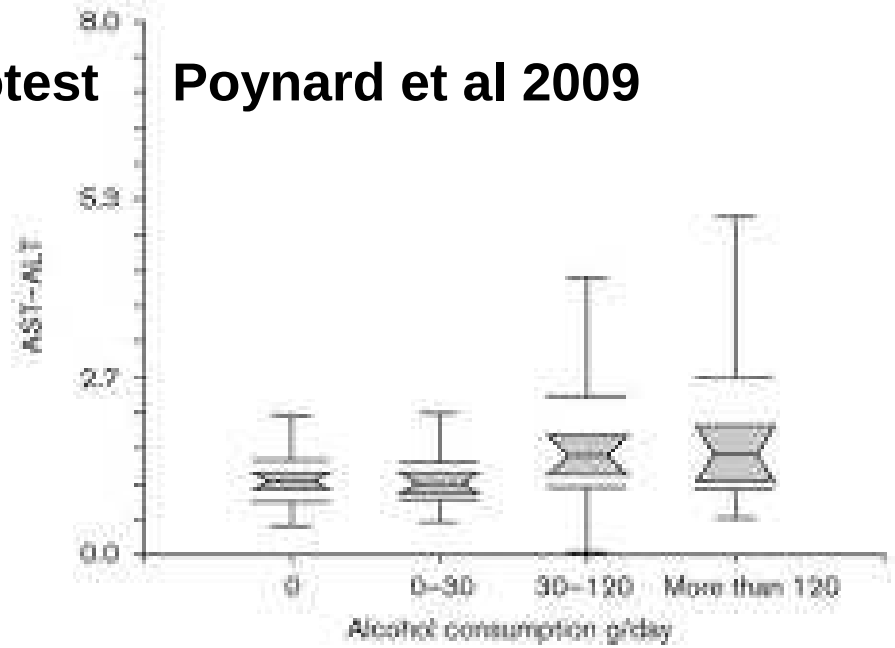
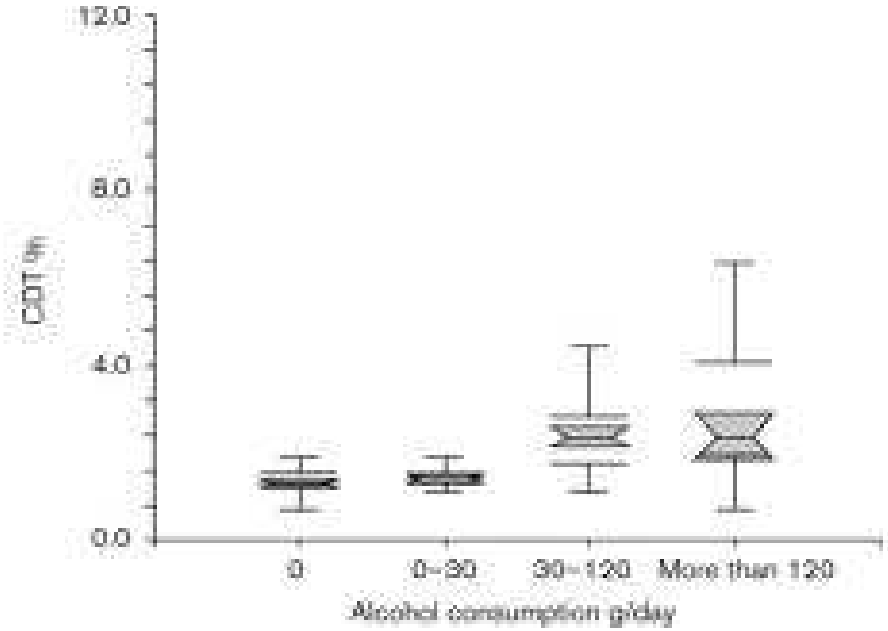
Poynard et al 2009







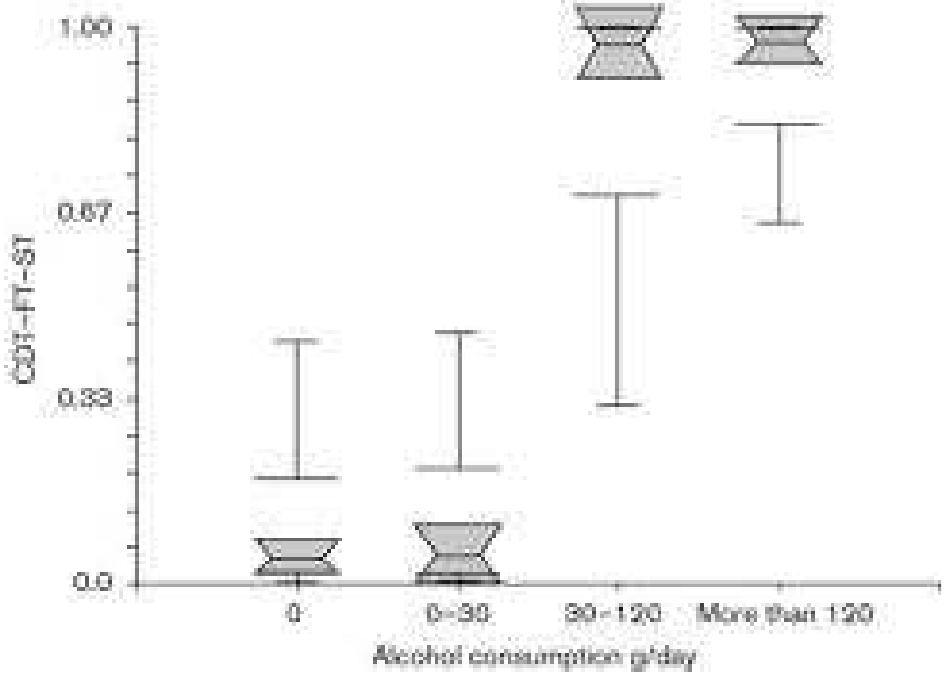


Fig. 2

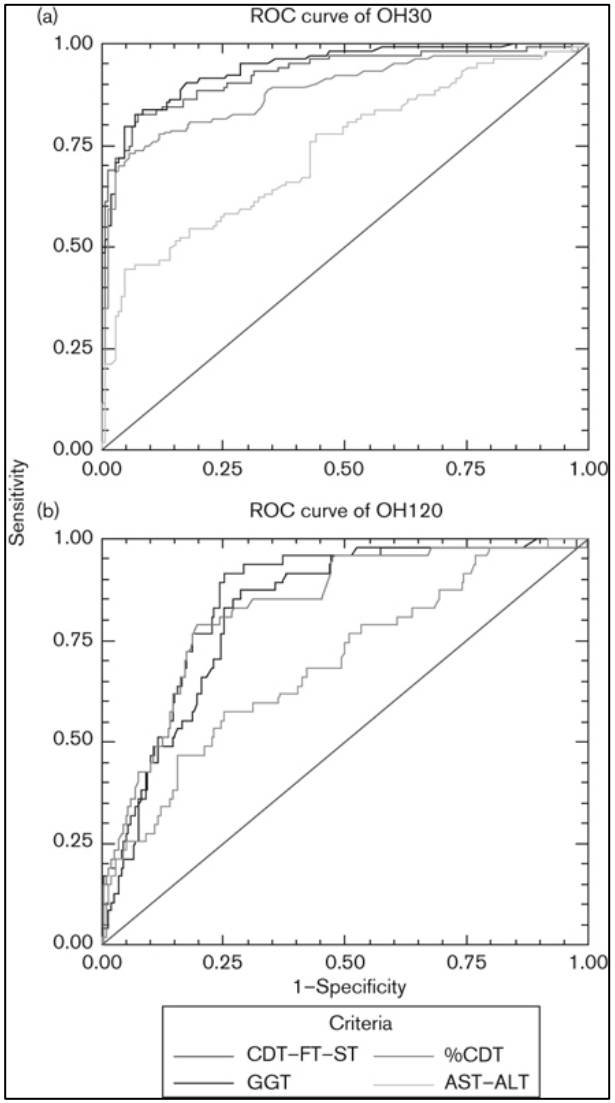


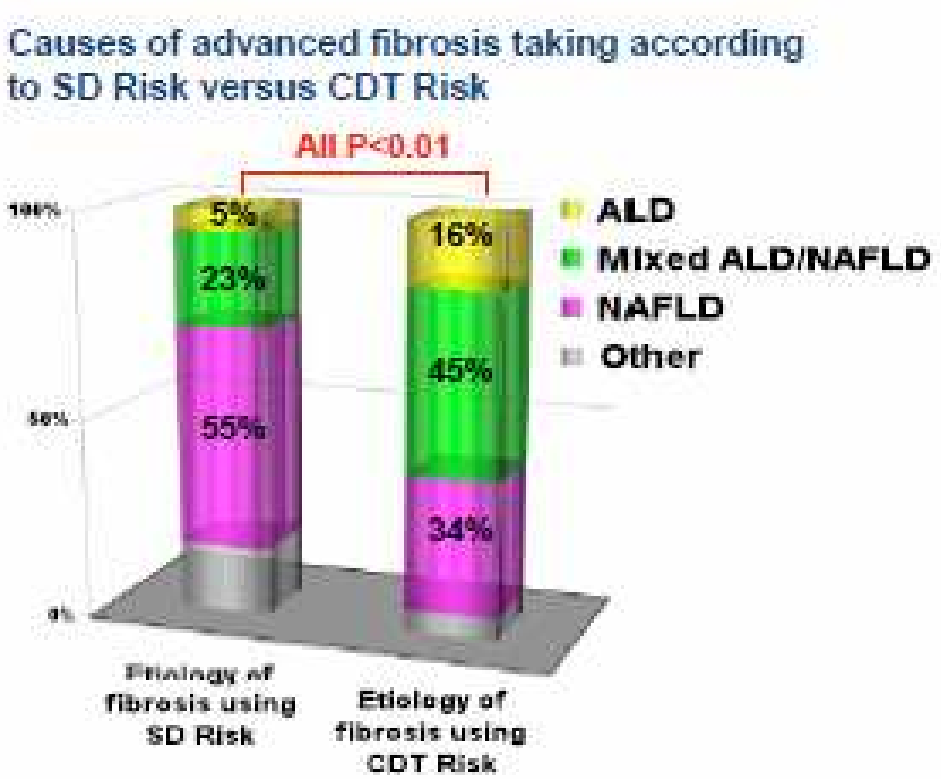
The diagnostic value of combining carbohydrate-deficient transferrin, fibrosis, and steatosis biomarkers for the prediction of excessive alcohol consumption.
Imbert-Bismut, Francoise; Naveau, Sylvie; Morra, Rachel; Munteanu, Mona; Ratziu, Vlad; Abella, Annie; Messous, Djamila; Thabut, Dominique; Benhamou, Yves; Poynard, Thierry

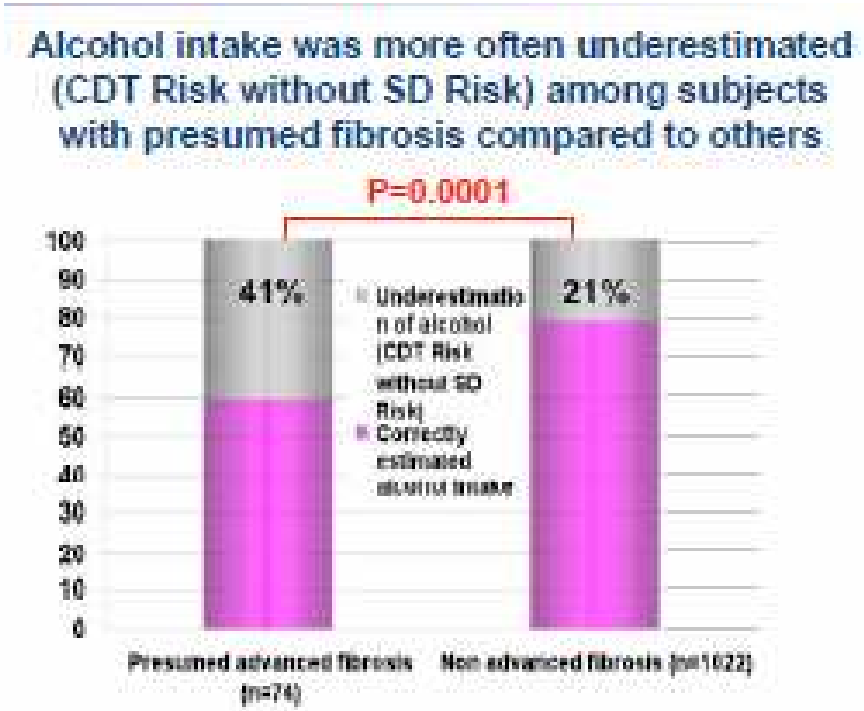
European Journal of Gastroenterology & Hepatology. 21(1):18-27, January 2009.
DOI: 10.1097/MEG.0b013e32830a4f4c

Fig. 2 Receiver operating characteristic (ROC) curves of biomarkers for the detection of excessive alcohol consumption of 30 g or more per day (a) and of 120 g or more per day (b). The diagonal line represents that achieved by chance alone [area under the receiver operating characteristic curve (AUROC) 0.50]; the ideal AUROC is 1.00. For the primary outcome, the detection of 30 g/day, the area under the curve of carbohydrate-deficient transferrin (CDT)-FibroTest (FT)- SteatoTest (ST) was 0.92 (95% confidence interval: 0.88-0.95), CDT% 0.88 (0.83-0.92) (P=0.004 vs. %CDT), [gamma]-glutamyl-transpeptidase (GGT) 0.94 (0.90-0.96), and 0.74 (0.66-0.79) for aspartate aminotransferase/alanine aminotransferase (AST/ALT), all highly significant versus 0.50 (PP=0.14 vs. %CDT), GGT 0.82 (0.75-0.87), and AST/ALT 0.69 (0.59-0.77), all highly significant versus 0.50 (P<0.0001).

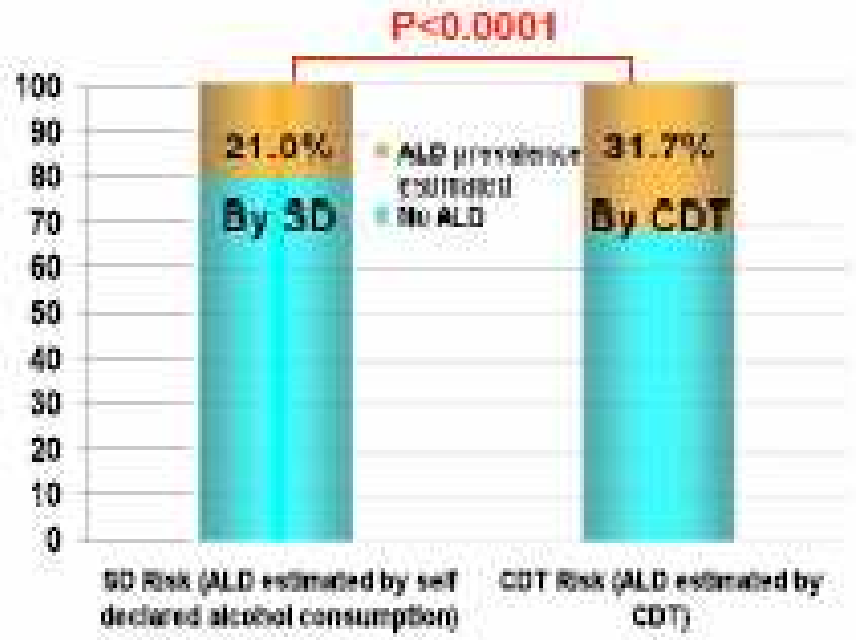
OVERESTIMATION OF « PURE » NAFLD AS A CAUSE OF LIVER FIBROSIS USING ALCOHOM CONSUMPTION ESTIMATED BY SD

Poynard et al

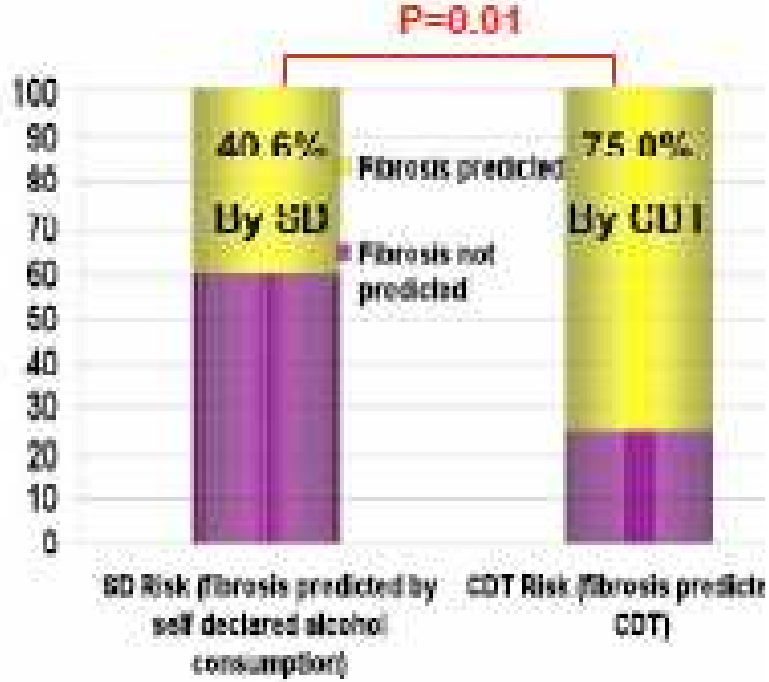




Higher ALD prevalence estimated using CDT versus self-declared alcohol consumption (SD)



Better prediction of *confirmed* advar fibrosis by using CDT versus SD R



Multivariate analyses: CDT predicted advanced fibrosis stronger than self declared (SD) risk

Factors	Odds ratio (OR)	P value
CDT	2.3	0.001
Self Declared consumption (SD)	0.99	NS

*Multivariate analyses included age, gender, metabolic factors

Triglycerides (a common marker of both metabolic and alcoholic risks) were no longer associated with advanced fibrosis after adjustment using CDT.

POURQUOI EVALUER NON INVASIVEMENT LA FIBROSE HEPATIQUE

- **Intérêt diagnostique : F0-1 vs ≥ F2 vs ≥3-4**
- **Intérêt pronostique**
- **Suivi des patients traités et non traités**

Pourquoi évaluer la fibrose?

- Y a-t-il une fibrose significative ?

⇨ Traiter si ≥ F2

- Y a-t-il une cirrhose ?

⇨ Traiter
Dépister le cancer

Indications au Traitement (Section 4.6)

- Un traitement doit être envisagé pour les patients ayant des taux d'ADN VHB au-dessus de 2000 UI/ml (i.e. environ 10 000 copies/ml)

Et/ou

- Des taux sériques d'ALAT au-delà de la limite supérieure de la normale (LSN),

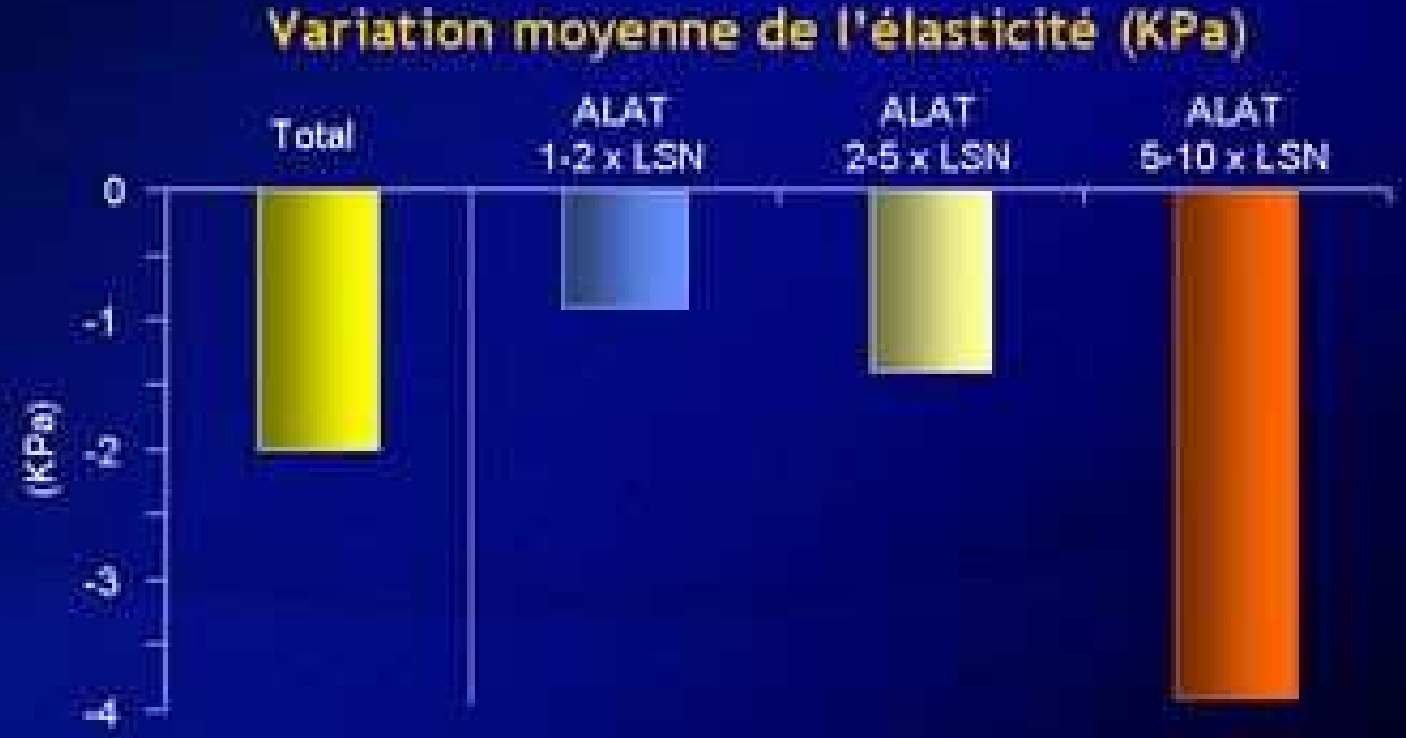
et

- Une biopsie hépatique montrant une nécro-inflammation et/ou une fibrose modérée à sévère utilisant un score standardisé (par ex. Au moins un grade A2 ou un stade F2 avec le score METAVIR). (A1)

European Association for the Study of the Liver. EASL Clinical Practice Guidelines: Management of chronic hepatitis B. *Journal of Hepatology* 50 (2009) 227–242

Le taux de transaminases influence la valeur du FibroScan®

- 38 patients porteurs chroniques du VHB et ↑ ALAT (< 10 x LSN)
- Le même jour : biopsie hépatique et 1re mesure par FibroScan®
- Tous les patients avaient une fibrose ≥ F2 (metavir)
- Traitement (adéfovir ou clévudine) et 2e mesure par FibroScan® après normalisation des transaminases à 3 mois en médiane [1-7]



AASLD 2009 – Fung J, Chine, Abstract 1449 actualisé

Fibrosis Progression in Chronic Hepatitis C

Importance of 2 Gene Variants

	Population at Risk (%)*	
	UCSF	VCU
Gender (Male vs Female)	83.7	57.8
Age of infection (≥40 vs <40 years)	2.5	6.4
Daily alcohol (≥50g vs <50g)	46.4	16.2
Ethnicity (Caucasians vs Others)	69.0	70.6
CPT1A_SNP† (CT+TT vs CC)	9.0	11.0
DDX5_SNP (AC+CC vs AA)	12.4	10.6
DDX5-POLG2 Diplotype (Group D1 vs D3)	12.4	10.6
DDX5-POLG2 Diplotype (Group D2 vs D3)	38.0	29.4

*Population at risk indicates the % of subjects from 2 cohorts carrying the risk factors.

†The odds ratio of CPT1A SNP was reversed to be consistent with other factors; therefore, the odds ratio for this SNP should be explained as a protective effect.

UCSF = University of California San Francisco; VCU = Virginia Commonwealth University; SNP = single nucleotide polymorphism.
